Chem. 266:16903-16910(1991). -i- FUNCTION: A PROTEINASE ACTIVATES THE INHIBITOR BY SPECIFIC PROTEOLYSIS IN THE BAIT REGION, WHICH, BY MUKNOWN MECHANISM LEADS TO REACTION AT THE CYSTEINYL-GLUTAMYL INTERNAL THIOL ESTIE SITE AND TO A CONFORMATIONAL CHANGE, WHEREBY THE PROTEINASE IS TRAPPED AND/OR COVALENTLY BOUND TO THE INHIBITOR. WHILE IN THE TETRAMERIC PROTEINASE INHIBITORS STERIC INHIBITION IS SUFFICIEN STRONG, MONOMERIC FORMS NEED A COVALENT LINKAGE BETWEEN THE ACTIVATED GLUTAMYL RESIDUE OF THE ORIGINAL THIOL ESTER AND A TERMINAL MAINO GROUP OF A LYSINE OR ANOTHER NUCLEOPHILIC GROUP THE PROTEINASE, FOR INHIBITION TO BE EFFECTIVE. -!- SIBLILARITY: TO OPHER PROTEINS OF THE ALPHA-MACROGLOBULIN FAMILY INCLUDING COMPLEMENT COMPONENTS C3, C4, AND C5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ATP.

SUBUNIT: Monomer. Oligomerizes upon binding of cytochrome c addrp. Oligomeric Apaf-1 and pro-caspase-9 bind to each other their respective NH2-terminal CARD domains and consecutively mature caspase-9 is released from the complex.

SUBCELLULAR LOCATION: Cytoplasmic.

ALTERNATIVE PRODUCTS: 5 isoforms; 1/Apaf-1XL (shown here), 2, 11 3/Apaf-1S. 4/Apaf-1M and 5/Apaf-1XS; are produced by
                                                                                                                                                                                                                                                                                                                                                                                     INDUCTION: By E2F and p53 in apoptotic neurons. SIMILARITY: CONTAINS 1 CARD DOMAIN. SIMILARITY: CONTAINS 13 MD REPEARS (TRP-ASP DOM SIMILARITY: CONTAINS 1 NB-ARC DOMAIN.
                                                                                                                                                                                                                                                                                                                                        CAUTION: Ref.7 sequence differs from that shown due to frameshift in position 109.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TISSUE SPECIFICITY: Ubiquitous. Highest levels of expression in adult spleen and peripheral blood leukocytes, and in fetal brain,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1L, 3/Apaf-1S, 4/Apaf-1M and 5/Apaf-1XS; alternative splicing.

1. SUBCELLULAR LOCATION: EXCLAGED 1111ar.

1. SUBCELLULAR LOCATION: EXCLAGED 1111ar.

1. PIM: SPECIFICITY: FOUND IN THE BASEMENT MEMBRANES.

1. PIM: CONTAINS THREE HEPARAN SULFATE CHAINS AS WELL AS N-LINKED AND O-LLINKED OLIGOSACCHARIDES.

1. SIMILARITY: CONTAINS 4 LDL-RECEPTOR CLASS A DOMAINS.

1. SIMILARITY: CONTAINS 10.5 LAMININ EGF-LIKE DOMAINS.

1. SIMILARITY: CONTAINS 3 LAMININ DOMAINS IV.

1. SIMILARITY: CONTAINS 3 LAMININ G-LIKE C2-TYPE DOMAINS.

1. SIMILARITY: CONTAINS 3 LAMININ G-LIKE DOMAINS.

1. SIMILARITY: CONTAINS 1 EGF-LIKE DOMAINS.

1. SIMILARITY: CONTAINS 1 SEA DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           basement membrane heparan sulfate proteoglycan.*;

-I- FUNCTION: THIS PROTEIN IS AN INTEGRAL COMPONENT OF BASEMENT MEMBRANES. IT IS RESPONSIBLE FOR THE FIXED NEGATIVE ELECTROSTATIC CHARGE AND IS INVOLVED IN THE CHARGE-SELECTIVE ULTRAFILTRATION PROPERTIES. IT INTERACTS WITH OTHER BASEMENT MEMBRANE COMPONENTS SUCH AS LAMINIA AND COLLAGEN TYPE IV AND SERVES AS AN ATTACHMENT SUBSTRATE FOR CELLS:
SUBSTRATE FOR CELLS:
SUBBUNIT: PURIFIED PERLECAN HAS A STRONG TENDENCY TO AGGREGATE IN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This SWISS-PROT entry is copyright. -- FUNCTION: May be implicated in apoptosis (By similarity).

-- COFACTOR: Binds ATP (By similarity).

-- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

-- ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here) and 2; and produced by alternative splicing.

-- SIMILARITY: CONTAINS 1 DAPIN DOMAIN.

-- SIMILARITY: CONTAINS 1 NACHT DOMAIN.

-- SIMILARITY: CONTAINS 9 LEGCINE-RICH REPEATS (LRR).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ACTIVATION.

SIMILARITY: THE ACTIN-BINDING DOMAIN IS OF A TYPE FOUND IN MANY ACTIN-BINDING PROTEINS (SUCH AS ACTININ, DYSTROPHIN, FIMBRIN, ABP-120, ABP-180, OR BETA-FODRIN).

ABP-120, ABP-180, OR BETA-FODRIN).

SIMILARITY: CONTAINS 2 CALPONIN-HOMOLOGY (CH) DOMAINS.

SIMILARITY: CONTAINS 24 FILAMIN REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PTM: PHOSPHORYLATION EXTENT CHANGES IN RESPONSE TO CELL

                          Submitted (JUN-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: IMPLICATED AS A TUMOR SUPPRESSOR GENE.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- ALTERNATIVE PRODUCTS: TWO FORMS OF THE PROTEIN ARE PRODUCED THE SAME GENE BY THE USE OF ALTERNATIVE INITIATION SITES. A FORM WHICH IS EXPRESSED ONLY IN THE EMBRYO IS PRODUCED BY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2204

MISCELLANEOUS: Ryanodine is an alkaloid that binds to the Carelease channel in junctional SR and modulates its activity.

SIMILARITY: BELONGS TO THE RYANODINE RECEPTOR FAMILY.

SIMILARITY: CONTAINS 3 SPRY DOMAINS.

CAUTION: Ref. 2 sequence differs from that shown due to probab frameshift errors at position 742-766.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SUBUNIT: Homotetramer (Potential).

SUBCELLULAR LOCATION: Integral membrane protein (Probable).

ALTERNATIVE PRODUCTS: 3 isoforms; 1 (shown here), 2 and 3; are produced by alternative splicing.

TISSUE SPECIFICITY: Brain, skeletal muscle, placenta and possibly liver and kidney. In brain, highest levels are found in the correbellum, hippocampus, caudate nucleus and amygdala, with lower levels in the corpus callosum, substantia nigra and thalamus.

MISCELLANEOUS: The calcium release channel is modulated by calcium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ions, magnesium ions, ATP and calmodulin.

MISCELLANEOUS: The calcium release channel activity resides in C-terminal region while the remaining part of the protein constitutes the 'foot' structure spanning the junctional gap between the SR and the T-tubule. It is possible that the foot structure interacts with the cytoplasmic region of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     FUNCTION: Communication between transverse-tubules and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              triggered by release of calcium ions from SR depolarization of T-tubules (By similarity).
